07	Warning in accordance with Article 6(7), second subparagraph of Regulation (EU) 2023/1114	Warning This summary should be read as an introduction to the crypto-asset white paper. The prospective holder should base any decision to purchase this crypto – asset on the content of the crypto-asset white paper as a whole and not on the summary alone. The admission to trading of this crypto-asset does not constitute an offer or solicitation to purchase financial instruments and any such offer or solicitation can be made only by means of a prospectus or other offer documents pursuant to the applicable national law. This crypto-asset white paper does not constitute a prospectus as referred to in Regulation (EU) 2017/1129 of the European Parliament and of the Council (36) or any other offer document pursuant to Union or national law.
08	Characteristics of the crypto-asset	LOCK IN (LOCKIN) is a Solana-based fungible crypto-asset token. It is transferable on the Solana network and can be freely traded or held by participants. Its value derives solely from community adoption and market demand.
09	Key information about the quality and quantity of the goods or services to which the utility tokens give access	N/A
10	Key information about the offer to the public or admission to trading	Kraken seeks admission to trading of the LOCKIN token so as to be compliant with MiCA and in keeping with its mission to make available for trading to its clients a wide range of assets.

# 8 of 30

		Liquidity: Liquidity refers to the ability to buy or sell a crypto-asset without causing
1.3	Crypto-Assets-related Risks	Market Volatility: The crypto-asset market is subject to significant price volatility, which may affect the value of LOCKIN. Prices can fluctuate rapidly and unpredictably due to various factors, including market sentiment, economic indicators, technological developments, regulatory news, and macroeconomic trends. This high level of volatility may lead to sudden gains or losses and can impact the liquidity and tradability of the crypto-asset.
		Legal and Regulatory Risks:  Because the project is not operated by a registered company, there is no clear legal entity accountable for LOCKIN. This could pose challenges if regulatory authorities seek compliance or if disputes arise, as holders might have limited recourse. Furthermore, changes in laws or enforcement could impact the project's ability to operate if it cannot meet regulatory requirements due to its decentralized structure.
		Governance and Internal Control Risks: With an anonymous or pseudonymous team, there is limited transparency and accountability. This could lead to potential mismanagement or misalignment with community interests. The absence of formal governance frameworks increases uncertainty, as key decisions may be made without external oversight.
1.2	Issuer-Related Risks	The LOCKIN project's informal structure and lack of a formal legal entity present several issuer-related risks.
		Security Risks: The risk of exploitation, hacking or security vulnerabilities of the underlying protocol and or contracts of the token leading to a loss.
		Regulatory Risks: Changes in legislation, applicable laws, compliance requirements or the implementation of new regulatory frameworks could affect the availability, trading, or use of such assets.
		Market Volatility: The value of LOCKIN may experience substantial fluctuations driven by investor sentiment, macroeconomic developments, and market conditions.
l.1	Offer-Related Risks	General Risk Factors Associated with Crypto-Asset Offerings: The admission to trading of crypto-assets, including LOCKIN, is subject to general risks inherent to the broader cryptocurrency market.

		significant price impact. LOCKIN may experience periods of low liquidity, meaning that it could be difficult to enter or exit positions at desired prices or volumes. Reduced liquidity may result from limited market participation, exchange restrictions, or broader market conditions. This can lead to increased price volatility, slippage, and difficulty in executing transactions.
		Cybersecurity & Technology Risks: Risks arising from vulnerabilities in the blockchain technology used by the project or platforms. Example risks include smart contract exploits, compromise of platforms, forking scenarios, compromise of cryptographic algorithms.
		Adoption Risks: The risk associated with the project not achieving its goals leading to lower than expected adoption and use within the ecosystem, the impact leading to a reduced utility and value proposition.
		Custody & Ownership Risk: The risk related to the inadequate safekeeping and control of crypto-assets e.g. loss of private keys, custodian insolvency leading to a loss."
1.4	Project Implementation-Relat ed Risks	The implementation of the LOCK IN project may face challenges that could adversely affect its success.  Operational Challenges: As a community-driven initiative without formal management, coordinating development, marketing, and community engagement can be difficult. The lack of a structured management process might result in inefficiencies or inconsistent progress.
		<b>Team Continuity Risk:</b> The project's progress depends on its contributors. If key community leaders leave the project or lose interest, there may be setbacks or discontinuation of certain project aspects.
1.5	Technology-Related Risks	Smart contract risks:  LOCKIN uses smart contracts to facilitate automated transactions and processes. While these contracts enhance efficiency and decentralization, they also introduce specific technical risks. Vulnerabilities such as coding errors, design flaws, or security loopholes within the smart contract code may be exploited by malicious actors. Such exploits could result in the loss of assets, unauthorized access to sensitive information, or unintended and irreversible execution of transactions.
		Blockchain Network Risks: LOCKIN operates on a public blockchain infrastructure, which is maintained by a decentralized network of participants. The functionality and reliability of the

A.3	Registered address	N/A
	Legal form	N/A
A.1 A.2	Name	N/A
	\ - Information about t	he offeror or the person seeking admission to trading
1.6	Mitigation measures	Use of Established Standards: LOCKIN is implemented using a well-tested token standard, SPL on Solana, which has been widely used and vetted. By adhering to a standard protocol and not using unproven custom code where unnecessary, the project reduces the likelihood of unknown bugs.
		Risk of Cryptographic Vulnerabilities: Technological advancements, such as quantum computing, could pose potential risks to cryptocurrencies.  Privacy: Transactions involving LOCKIN are recorded on a public blockchain, where transaction data is transparent and permanently accessible. While public addresses do not directly reveal personal identities, transaction histories can be analyzed and, in some cases, linked to individuals through data aggregation or external information sources. This transparency may pose privacy concerns for users seeking confidentiality in their financial activity. Participants should be aware that transaction data on public blockchains is not inherently private and could be subject to scrutiny by third parties, including regulators, analytics firms, or malicious actors.
		crypto-asset are dependent on the performance and security of the underlying blockchain. Risks may include network congestion, high transaction fees, delayed processing times, or, in extreme cases, outages and disruptions. Additionally, vulnerabilities or failures in the consensus mechanism, attacks on the network (e.g., 51% attacks), or protocol-level bugs could impact the operation and availability of LOCKIN.

Payward, through its various affiliates, offers a number of other services and products, including:  * A trading platform for futures contracts on virtual assets ("Kraken Derivatives");  * A platform for buying and selling NFTs;  * An over-the-counter ("OTC") desk;  * Extensions of margin to support spot trading of virtual assets;  * A benchmark administrator; and  * Staking services.	

D.3		
	Abbreviation	LOCKIN
D.4	Crypto-asset project description	The LOCK IN project is a community-driven crypto initiative on the Solana blockchain centered around the LOCKIN token. It was launched as a meme-inspired token project, aiming to build a community and ecosystem around a fun and accessible digital asset.  LOCK IN exists mainly on social platforms, with a website offering a profile-picture generator for community members.
D.5	Details of all natural or legal persons involved in the implementation of the crypto-asset project	The LOCK IN project is developed and maintained by a group of anonymous or pseudonymous contributors from the community. No specific individuals or legal entities have been officially disclosed as core team members.
D.6	Utility Token Classification	false
D.7	Key Features of Goods/Services for Utility Token Projects	N/A
D.8	Plans for the token	Please refer to project team website for any further information regarding future milestone
D.9	Resource Allocation	The LOCK IN project has not publicly detailed any specific financial resources allocated to the project. There was no traditional fundraising round (such as an ICO/ITO) for LOCKIN, and no treasury or budget disclosures have been made. Any development or marketing efforts so far appear to be volunteer-driven or informally supported by community donations. As a result, there is no verified information on funds earmarked for project development, liquidity, or other purposes.

Part H – information on the underlying technology				
Distributed ledger technology	LOCKIN is implemented on the Solana network. Solana is a public blockchain that uses a combination of Proof-of-Stake (PoS) and Proof-of-History (PoH) for consensus. This technology ensures that LOCKIN transactions can be recorded, validated, and secured in a decentralized manner.			
Protocols and technical standards	The LOCKIN token is based on the Solana network, which utilizes decentralized Distributed-Ledger Technology. This protocol provides the foundation for secure transactions and smart contracts. SPL Token Standard: The SPL standard is a technical protocol for issuing and managing tokens, ensuring that the LOCKIN token is compatible with most wallets, exchanges, and decentralized applications (DApps).

H.3		
11.5	Technology Used	The LOCKIN token uses the existing SPL token standard on Solana.
H.4	Consensus Mechanism	Solana uses Proof-of-Stake with Tower BFT and Proof-of-History, where leaders are pre-selected by stake and transactions, including LOCKIN transfers, receive sub-second confirmation and high throughput.
H.5		
	Incentive Mechanisms and Applicable Fees	LOCKIN relies on the existing incentive mechanisms and fee structures of the Solana blockchain.
H.6	Use of Distributed Ledger Technology	false
H.7	DLT Functionality Description	N/A
H.8	Audit	false
H.9	Audit outcome	N/A
	- Information on the sonment-related advers	suitability indicators in relation to adverse impact on the climate and other e impacts
S.1	Name	Payward Global Solutions Limited
S.2	Relevant legal entity identifier	9845003D98SCC2851458
S.3	Name of the crypto-asset	lock_in
S.4	Consensus Mechanism	Solana uses a unique combination of Proof of History (PoH) and Proof of Stake (PoS) to achieve high throughput, low latency, and robust security.
		Core Concepts:  1. Proof of History (PoH):  - Time-Stamped Transactions: PoH is a cryptographic technique that timestamps transactions, creating a historical record that proves that an event has occurred at a specific moment in time.

Verifiable Delay Function: PoH uses a Verifiable Delay Function (VDF)
to generate a unique hash that includes the transaction and the time it
was processed. This sequence of hashes provides a verifiable order of
events, enabling the network to efficiently agree on the sequence of
transactions.

# 2. Proof of Stake (PoS):

- Validator Selection: Validators are chosen to produce new blocks based on the number of SOL tokens they have staked. The more tokens staked, the higher the chance of being selected to validate transactions and produce new blocks.
- Delegation: Token holders can delegate their SOL tokens to validators, earning rewards proportional to their stake while enhancing the network's security.

#### Consensus Process:

## 1. Transaction Validation:

Transactions are broadcast to the network and collected by validators. Each transaction is validated to ensure it meets the network's criteria, such as having correct signatures and sufficient funds.

### 2. PoH Sequence Generation:

A validator generates a sequence of hashes using PoH, each containing a timestamp and the previous hash. This process creates a historical record of transactions, establishing a cryptographic clock for the network.

### 3. Block Production:

The network uses PoS to select a leader validator based on their stake. The leader is responsible for bundling the validated transactions into a block. The leader validator uses the PoH sequence to order transactions within the block, ensuring that all transactions are processed in the correct order.

#### 4. Consensus and Finalization:

Other validators verify the block produced by the leader validator. They check the correctness of the PoH sequence and validate the transactions within the block. Once the block is verified, it is added to the blockchain. Validators sign off on the block, and it is considered finalized.

## Security and Economic Incentives:

# 1. Incentives for Validators:

- Block Rewards: Validators earn rewards for producing and validating blocks. These rewards are distributed in SOL tokens and are proportional to the validator's stake and performance.

		- Transaction Fees: Validators also earn transaction fees from the
		transactions included in the blocks they produce. These fees provide
		an additional incentive for validators to process transactions efficiently.
		2. Security:
		- Staking: Validators must stake SOL tokens to participate in the
		· · ·
		consensus process. This staking acts as collateral, incentivizing
		validators to act honestly. If a validator behaves maliciously or fails to
		perform, they risk losing their staked tokens.
		- Delegated Staking: Token holders can delegate their SOL tokens to
		validators, enhancing network security and decentralization. Delegators
		share in the rewards and are incentivized to choose reliable validators.
		3. Economic Penalties:
		Slashing: Validators can be penalized for malicious behavior, such as
		double-signing or producing invalid blocks. This penalty, known as
		slashing, results in the loss of a portion of the staked tokens,
		discouraging dishonest actions.
S.5	Incentive	Solana uses a combination of Proof of History (PoH) and Proof of Stake (PoS)
	Mechanisms and	to secure its network and validate transactions.
	Applicable Fees	
	/ Applicable 1 ccc	Incentive Mechanisms:
		1. Validators:
		- Staking Rewards: Validators are chosen based on the number of SOL
		tokens they have staked. They earn rewards for producing and
		validating blocks, which are distributed in SOL. The more tokens
		staked, the higher the chances of being selected to validate
		transactions and produce new blocks.
		- Transaction Fees: Validators earn a portion of the transaction fees paid
		by users for the transactions they include in the blocks. This provides
		an additional financial incentive for validators to process transactions
		efficiently and maintain the network's integrity.
		2. Delegators:
		- Delegated Staking: Token holders who do not wish to run a validator
		node can delegate their SOL tokens to a validator. In return, delegators
		share in the rewards earned by the validators. This encourages
		widespread participation in securing the network and ensures
		decentralization.
		3. Economic Security:
		- Slashing: Validators can be penalized for malicious behavior, such as
		producing invalid blocks or being frequently offline. This penalty, known
		as slashing, involves the loss of a portion of their staked tokens.
		Slashing deters dishonest actions and ensures that validators act in the
		best interest of the network.
		- Opportunity Cost: By staking SOL tokens, validators and delegators
		lock up their tokens, which could otherwise be used or sold. This
	1	, , , , , , , , , , , , , , , , , , , ,

		opportunity cost incentivizes participants to act honestly to earn rewards and avoid penalties. Fees Applicable on the Solana Blockchain
		Transaction Fees:  1. Low and Predictable Fees:  Solana is designed to handle a high throughput of transactions, which helps keep fees low and predictable. The average transaction fee on Solana is significantly lower compared to other blockchains like Ethereum.  2. Fee Structure:
		Fees are paid in SOL and are used to compensate validators for the resources they expend to process transactions. This includes computational power and network bandwidth.
		<ul> <li>3. Rent Fees:         <ul> <li>State Storage: Solana charges rent fees for storing data on the blockchain. These fees are designed to discourage inefficient use of state storage and encourage developers to clean up unused state. Rent fees help maintain the efficiency and performance of the network.</li> </ul> </li> <li>4. Smart Contract Fees:         <ul> <li>Execution Costs: Similar to transaction fees, fees for deploying and interacting with smart contracts on Solana are based on the computational resources required. This ensures that users are charged</li> </ul> </li> </ul>
		proportionally for the resources they consume.
S.6	Beginning of the period to which the disclosure relates	2024-05-28
S.7	End of the period to which the disclosure relates	2025-05-28
S.8	Energy consumption	26.41948 kWh/a
S.9	Energy consumption sources and methodologies	The energy consumption of this asset is aggregated across multiple components:  To determine the energy consumption of a token, the energy consumption of
		the network(s) solana is calculated first. For the energy consumption of the token, a fraction of the energy consumption of the network is attributed to the token, which is determined based on the activity of the crypto-asset within the network. When calculating the energy consumption, the Functionally Fungible Group Digital Token Identifier (FFG DTI) is used - if available - to determine all implementations of the asset in scope. The mappings are updated regularly, based on data of the Digital Token Identifier Foundation. The information

	regarding the hardware used and the number of participants in the network is
	based on assumptions that are verified with best effort using empirical data. In
	general, participants are assumed to be largely economically rational. As a
	precautionary principle, we make assumptions on the conservative side when
	in doubt, i.e. making higher estimates for the adverse impacts.
